

Part 5

Control Logic

Intel x86 Jump Instructions

Fly over code

Operations: Program Flow Control

- Unlike high-level languages, processors don't have fancy expressions or blocks
- Programs are controlled by jumping over blocks of code based on status flags

2/27/2017

Sacramento State - Cook - CSc 35 - Spring 2017

3

Operations: Program Flow Control

- The processor moves the program counter (*where your program is running in memory*) to a new address and execution continues

2/27/2017

Sacramento State - Cook - CSc 35 - Spring 2017

4

Types of Jumps: Unconditional

- Unconditional jumps simply transfer the running program to a new address
- Basically, it just "gotos" to a new line
- These are used extensively to recreate the blocks we use in 3GLs (like Java)

2/27/2017

Sacramento State - Cook - CSc 35 - Spring 2017

5

Types of Jumps: Conditional

- Conditional jumps (aka *branching*) will only jump if a certain condition is met
- What happens
 - processor jumps *if and only if* a specific status flag is set
 - otherwise, it simply continues with the next instruction

2/27/2017

Sacramento State - Cook - CSc 35 - Spring 2017

6

Instruction: Compare

- Performs a comparison operation between two arguments
- The result of the comparison is used for conditional jumps
- Necessary to construct all conditional statements – if, while, ...

2/27/2017

Sacramento State - Cook - CSc 35 - Spring 2017

7

Instruction: Compare

- Behind the scenes...
 - first argument is subtracted from the second
 - both values are interpreted as signed integers and both are sign-extended to the same size
 - subtraction result is discarded

2/27/2017

Sacramento State - Cook - CSc 35 - Spring 2017

8

Instruction: Compare

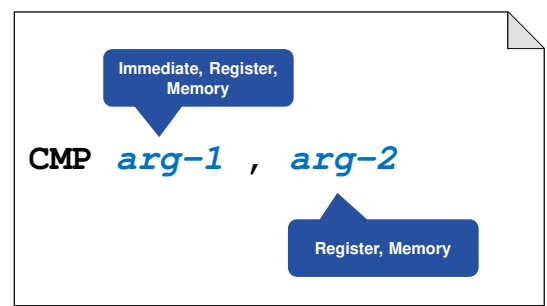

- Why subtract the operands?
- The result can tell you which is larger
- For example: A and B are both positive...
 - $A - B \rightarrow$ positive number \rightarrow A was larger
 - $A - B \rightarrow$ negative number \rightarrow B was larger
 - $A - B \rightarrow$ zero \rightarrow both numbers are equal

2/27/2017

Sacramento State - Cook - CSc 35 - Spring 2017

9

Instruction: Compare

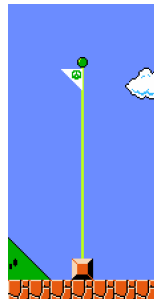

2/27/2017

Sacramento State - Cook - CSc 35 - Spring 2017

10

Flags

- A *flag* is a Boolean value that indicates the result of an action
- These are set by various actions such as calculations, comparisons, etc...

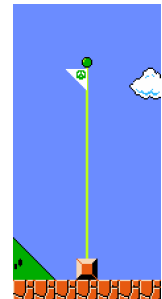

2/27/2017

Sacramento State - Cook - CSc 35 - Spring 2017

11

Flags

- Flags are typically stored as individual bits in the *Status Register*
- You can't change the register directly, but numerous instructions use it for control and logic

2/27/2017

Sacramento State - Cook - CSc 35 - Spring 2017

12

Zero Flag (ZF)

- True if the last computation resulted in zero (all bits are 0)
- For compare, the zero flag indicates the two operands are equal
- Used by quite a few conditional jump statements

2/27/2017

Sacramento State - Cook - CSc 35 - Spring 2017

13

Sign Flag (SF)

- True if the *most significant bit* of the result is 1
- This would indicate a negative 2's complement number
- Meaningless if the operands are interpreted as unsigned

2/27/2017

Sacramento State - Cook - CSc 35 - Spring 2017

14

Carry Flag (CF)

- True if a 1 is "borrowed" when subtraction is performed
- ...or a 1 is "carried" from addition
- For unsigned numbers, it indicates:
 - exceeded the size of the register on addition
 - or an underflow (too small value) on subtraction

2/27/2017

Sacramento State - Cook - CSc 35 - Spring 2017

15

Overflow Flag (OF)

- Also known as "signed carry flag"
- True if the sign bit changed *when it shouldn't*
- For example:
 - (negative – positive number) should be negative
 - a positive result will set the flag
- For signed numbers, it indicates:
 - exceeded the size of the register on addition
 - or an underflow (too small value) on subtraction

2/27/2017

Sacramento State - Cook - CSc 35 - Spring 2017

16

x86 Flags Used by Compare

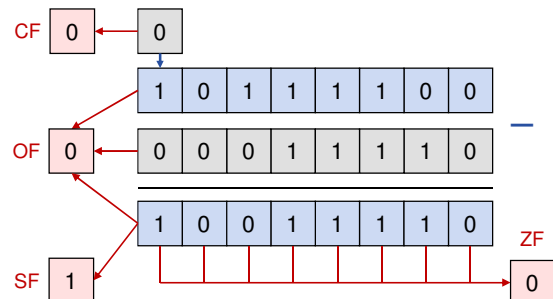

Name	Description	When True
CF	Carry Flag	If an extra bit was "carried" or "borrowed" during math.
ZF	Zero Flag	All the bits in the result are zero.
SF	Sign Flag	If the most significant bit is 1.
OF	Overflow Flag	If the sign-bit changed when it shouldn't have.

2/27/2017

Sacramento State - Cook - CSc 35 - Spring 2017

17

-68 vs. 30 (if interpreted as signed)
188 vs. 30 (if interpreted as unsigned)

2/27/2017

Sacramento State - Cook - CSc 35 - Spring 2017

18

Jump Instructions

- x86 contains a large number of conditional jump statements
- Each takes advantage of status flags (such as the ones set with compare)
- x86 assembly has several names for the same instruction – which adds readability

2/27/2017

Sacramento State - Cook - CSc 35 - Spring 2017

19

Jump on Equality

Jump	Description	When True
JE	Equal	ZF = 1
JNE	Not equal	ZF = 0

2/27/2017

Sacramento State - Cook - CSc 35 - Spring 2017

20

Conditional Jump Example

```

_start:
    cmp $13, %rax
    je  Equal
    ...
Equal:
    ...
    
```

Diagram illustrating a conditional jump example. A yellow arrow points from the `je` instruction to the `Equal` label. A blue callout box points to the `je` instruction with the text `rax = 13?`.

2/27/2017

Sacramento State - Cook - CSc 35 - Spring 2017

21

Signed Jump Instructions

Jump	Description	When True
JG	Jump Greater than	SF = OF, ZF = 0
JGE	Jump Greater than or Equal	SF = OF
JL	Jump Less than	SF ≠ OF, ZF = 1
JLE	Jump Less than or Equal	SF ≠ OF

2/27/2017

Sacramento State - Cook - CSc 35 - Spring 2017

22

Unsigned Jumps

Jump	Description	When True
JA	Jump Above	CF = 0, ZF = 0
JAЕ	Jump Above or Equal	CF = 0
JB	Jump Below	CF = 1, ZF = 1
JBE	Jump Below or Equal	CF = 1

2/27/2017

Sacramento State - Cook - CSc 35 - Spring 2017

23

Conditional Jump Example

```

_start:
    mov $42, %rax
    cmp $13, %rax
    jge Bigger
    ...
Bigger:
    add $5, %rax
    
```

Diagram illustrating a conditional jump example. A yellow arrow points from the `jge` instruction to the `Bigger` label. A blue callout box points to the `jge` instruction with the text `rax >= 13?` and `(yes, its backwards!)`.

2/27/2017

Sacramento State - Cook - CSc 35 - Spring 2017

24

If Statements on the x86

How to we conditional execute code?

If Statements in assembly

- High-level programming language have easy to use If-Statements
- However, processors handle all branching logic using jumps
- You basically jump over true and else blocks

2/27/2017

Sacramento State - Cook - CSc 35 - Spring 2017

26

If Statements in assembly

- Converting from an If Statement to assembly is easy
- Let's look at If Statements...
 - the block **only** executes if the expression is **true**
 - so, if the expression is false your program will skip over the block
 - this is a jump...

2/27/2017

Sacramento State - Cook - CSc 35 - Spring 2017

27

If Statement jumps over code

```
rax = 18;  
if (rax >= 21) False  
{  
    //true part  
}  
rbx = 12;
```

2/27/2017

Sacramento State - Cook - CSc 35 - Spring 2017

28

Converting an If Statement

- Compare the two values
- If the result is **false** ...
 - then jump over the true block
 - you will need label to jump to
- To jump on false, reverse your logic
 - $a < b \rightarrow \text{not } (a \geq b)$
 - $a \geq b \rightarrow \text{not } (a < b)$

2/27/2017

Sacramento State - Cook - CSc 35 - Spring 2017

29

Please Note...

- Following examples use **very generic label names**
- In your program, each label you create **must** be unique
- So, please don't think that each label (as it is typed) is "the" label you need to use

2/27/2017

Sacramento State - Cook - CSc 35 - Spring 2017

30

Converting an If Statement

```
if (rax >= 21)
{
    //true block
}
//end
```

JGE
(Jump Greater or Equal)

2/27/2017

Sacramento State - Cook - CSc 35 - Spring 2017

31

Jump over true part

```
cmp $21, %rax
jl End
#true block

End:
```

Branch when false.
JL (Jump Less Than) is the opposite of JGE

2/27/2017

Sacramento State - Cook - CSc 35 - Spring 2017

32

Jump over true part

```
cmp $21, %rax
jl End
#true block

End:
```

Jumps over true part

2/27/2017

Sacramento State - Cook - CSc 35 - Spring 2017

33

Else Clause

- The Else Clause is a tad more complex
- You need to have a true block and a false block
- Like before...
 - you must jump over instructions
 - just remember: *the program will continue with the next instruction unless you jump!*

2/27/2017

Sacramento State - Cook - CSc 35 - Spring 2017

34

Else Clause

```
if (rax >= 21)
{
    //true block
}
else
{
    //false block
}
//end
```

2/27/2017

Sacramento State - Cook - CSc 35 - Spring 2017

35

Jump over true part

```
cmp $21, %rax
jl Else
#true block
jmp End
Else:
#false block
End:
```

Jump to false block

False block flows down to End

2/27/2017

Sacramento State - Cook - CSc 35 - Spring 2017

36

Jump over true part

```
cmp $21, %rax
jl  Else

#true block
jmp End
Else:
#false block
End:
```

If we run the true block, we have to jump over the false block

2/27/2017

Sacramento State - Cook - CS535 - Spring 2017

37

Alternative Approach

- In the examples before, I put the False Block first and used inverted logic for the jump
- You can construct If Statements without inverting the conditional jump, but the format is layout is different

2/27/2017

Sacramento State - Cook - CS535 - Spring 2017

38

If Statement – No Else

```
cmp $21, %rax
jge Then
jmp End
Then:
#true block
End:
```

Jumps to true block

2/27/2017

Sacramento State - Cook - CS535 - Spring 2017

39

If Statement – No Else

```
cmp $21, %rax
jge Then
jmp End
Then:
#true block
End:
```

Jump to end if false (it didn't jump with JGE)

2/27/2017

Sacramento State - Cook - CS535 - Spring 2017

40

If Statement with Else

```
cmp $21, %rax
jge Then
#false block
jmp End
Then:
#true block
End:
```

Notice that this is identical to the last slide – the false block is just empty

2/27/2017

Sacramento State - Cook - CS535 - Spring 2017

41

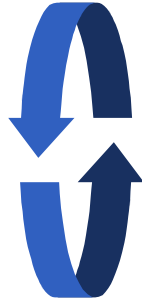

While Loops

Doing the same thing again and again
... and again

While Statement

- Processors do not have While Statements – just like If Statements
- Looping is performed much like an implementing an If Statement
- A While Statement is, in fact, the same thing as an If Statement

2/27/2017

Sacramento State - Cook - CSIS 35 - Spring 2017

43

If Statement vs. While Statement

If Statement	While Statement
Uses a conditional expression	Uses a conditional expression
Executes a block of statements	Executes a block of statements
Executes only once	Executes multiple times

2/27/2017

Sacramento State - Cook - CSIS 35 - Spring 2017

44

Converting a While Statement

- To create a While Statement
 - start with an If Statement and...
 - add an unconditional jump at the end of the block that jumps to the beginning
- You will "branch out" of an infinite loop
- Structurally, this is almost identical to what you did before
- However, you do need another label :(

2/27/2017

Sacramento State - Cook - CSIS 35 - Spring 2017

45

Converting an While Statement

```
while (rax >= 21)
{
    //true block
}
//end
```

JGE
(Jump Greater or Equal)

2/27/2017

Sacramento State - Cook - CSIS 35 - Spring 2017

46

Converting an While Statement

```
While:
    cmp    $21, %rax
    jl     End
    #true block
    jmp    While
End:
```

Branch when false. JL
(Jump Less Than) is
the opposite of JGE

2/27/2017

Sacramento State - Cook - CSIS 35 - Spring 2017

47

Converting an While Statement

```
While:
    cmp    $21, %rax
    jl     End
    #true block
    jmp    While
End:
```

Loop after block
executes

2/27/2017

Sacramento State - Cook - CSIS 35 - Spring 2017

48

Converting an While Statement

```
While:
    cmp    $21, %rax
    jl     End
    #true block
    jmp    While
End:
```

Escape infinite loop

2/27/2017

Sacramento State - Cook - CSc 35 - Spring 2017

49

Alternative Approach

- Before, we created an If Statement by inverting the branch logic (jump on false)
- You can, alternatively, also implement a While Statement without inverting the logic
- Either approach is valid – use what you think is best

2/27/2017

Sacramento State - Cook - CSc 35 - Spring 2017

50

Alternative Approach

```
while (rax >= 21)
{
    //true block
}
//end
```

2/27/2017

Sacramento State - Cook - CSc 35 - Spring 2017

51

Alternative Approach

```
While:
    cmp    $21, %rax
    jge    Do
    jmp     End
Do:
    #true block
    jmp    While
End:
```

Jumps to Do Block

2/27/2017

Sacramento State - Cook - CSc 35 - Spring 2017

52

Alternative Approach

```
While:
    cmp    $21, %rax
    jge    Do
    jmp     End
Do:
    #true block
    jmp    While
End:
```

bge was false, jump out of the loop

2/27/2017

Sacramento State - Cook - CSc 35 - Spring 2017

53

Alternative Approach

```
While:
    cmp    $21, %rax
    jge    Do
    jmp     End
Do:
    #true block
    jmp    While
End:
```

Repeat the loop

2/27/2017

Sacramento State - Cook - CSc 35 - Spring 2017

54

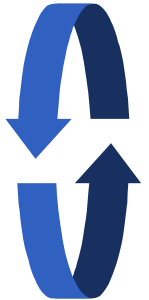

Do Loops

Test Last While Loops

Do Loops

- Programming languages also support test-last loop statements
- Many programming languages use the keyword "repeat" or "do"
- Easier than While Statements

2/27/2017 Sacramento State - Cook - CSc 35 - Spring 2017 56

Converting Do Loops

```
do
{
    //true block
}
while (rax >= 21);
//end
```

JGE (Jump Greater or Equal)

2/27/2017 Sacramento State - Cook - CSc 35 - Spring 2017 57

Converting Do Loops

```
Do:
    #true block
    cmp $21, %rax
    jge Do
```

Positive logic

2/27/2017 Sacramento State - Cook - CSc 35 - Spring 2017 58

Alternative Approach

- You can also implement Do Loops using negative logic
- But it requires a few an extra label and jump statement

2/27/2017 Sacramento State - Cook - CSc 35 - Spring 2017 59

Alternative Approach

```
Do:
    #true block
    cmp $21, %rax
    j1 End
    jmp Do
End:
```

Negative logic

2/27/2017 Sacramento State - Cook - CSc 35 - Spring 2017 60

Alternative Approach

```

Do:
    #true block

    cmp    $21, %rax
    jl     End
    jmp    Do
End:
    
```

Infinite loop

2/27/2017

Sacramento State - Cook - CSc 35 - Spring 2017

61

Switch Statements on the x86

Reason for the C, Java, and C# design

Switch Statements on the x86

- You might have noticed the strange behavior of Switch statements in C, Java, and C#
- Java and C# inherited their behavior from C

2/27/2017

Sacramento State - Cook - CSc 35 - Spring 2017

63

Switch Statements on the x86

- C, in turn, was designed for embedded systems
- Language creates very efficient assembly code
- The Switch Statement converts easily to efficient code

2/27/2017

Sacramento State - Cook - CSc 35 - Spring 2017

64

Switch Statement

- It is very efficient because...
 - it is restricted to integer constants
 - once a case is matched, no others are checked
 - they can fall through to match multiple values
- So, how?
 - start of the statement sets up just 1 register
 - compared to each "case" constant
 - jumps to a label created for each

2/27/2017

Sacramento State - Cook - CSc 35 - Spring 2017

65

Switch Statement Syntax

```

switch (integer)
{
    case value :
        Statements

    default:
        Statements
}
    
```

integer expression

You can have as many of these as needed

Executed if nothing matched

2/27/2017

Sacramento State - Cook - CSc 35 - Spring 2017

66

C/Java Code

```
switch (Party)
{
    case 1:
        Democrat();
    case 2:
        Republican();
    default:
        ThirdParty();
}
```

2/27/2017

Sacramento State - Cook - CSc 35 - Spring 2017

67

Assembly Code

```
mov Party, %rax
cmp $1, %rax
je case_1
cmp $2, %rax
je case_2
jmp default

case_1:
    call Democrat
case_2:
    call Republican
default:
    call ThirdParty
```

2/27/2017

Sacramento State - Cook - CSc 35 - Spring 2017

68

Assembly Code

```
mov Party, %rax
cmp $1, %rax
je case_1
cmp $2, %rax
je case_2
jmp default
```

Jump header

```
case_1:
    call Democrat
case_2:
    call Republican
default:
    call ThirdParty
```

2/27/2017

Sacramento State - Cook - CSc 35 - Spring 2017

69

Assembly Code: Jump Header

```
mov Party, %rax
cmp $1, %rax
je case_1
cmp $2, %rax
je case_2
jmp default
```

case 1:

case 2:

default:

2/27/2017

Sacramento State - Cook - CSc 35 - Spring 2017

70

Assembly Code

```
mov Party, %rax
cmp $1, %rax
je case_1
cmp $2, %rax
je case_2
jmp default
```

```
case_1:
    call Democrat
case_2:
    call Republican
default:
    call ThirdParty
```

Case Body

2/27/2017

Sacramento State - Cook - CSc 35 - Spring 2017

71

Assembly Code: The Case Body

```
case_1:
    call Democrat
case_2:
    call Republican
default:
    call ThirdParty
```

Each "falls through". They are just labels!

2/27/2017

Sacramento State - Cook - CSc 35 - Spring 2017

72

Fall-Through Labels

```
1
Democrat
Republican
Third Party
```

2/27/2017

Sacramento State - Cook - CSc 35 - Spring 2017

73

Break Statement

- Even in the last example, we still fall-through to the default
- The "Break" Statement is used exit a case
- Semantics
 - simply jumps to a label after the last case
 - so, break converts directly to a single jump

2/27/2017

Sacramento State - Cook - CSc 35 - Spring 2017

74

Java Code

```
switch (Party)
{
    case 1:
        Democrat();
        break;
    case 2:
        Republican();
        break;
    default:
        ThirdParty();
}
```

Let's jump to the end

2/27/2017

Sacramento State - Cook - CSc 35 - Spring 2017

75

Assembly Code: The Cases

```
case_1:
    call Democrat
    jmp End
case_2:
    call Republican
    jmp End
default:
    call ThirdParty
End:
```

Break jumps to the end

2/27/2017

Sacramento State - Cook - CSc 35 - Spring 2017

76

When Fallthrough Works

- The fallthrough behavior of C was designed for a reason
- It makes it easy to combine "cases" – make a Switch Statement match multiple values
- ... and keeps the same efficient assembly code

2/27/2017

Sacramento State - Cook - CSc 35 - Spring 2017

77

Java Code: Primes from 1 to 10

```
switch (number)
{
    case 2:
    case 3:
    case 5:
    case 7:
        result = True;
        break;
    default:
        result = False;
}
```

Match Multiple

2/27/2017

Sacramento State - Cook - CSc 35 - Spring 2017

78

Primes: Jump Header

```
mov Number, %rax
```

```
cmp $2, %rax  
je case_2  
cmp $3, %rax  
je case_3  
cmp $5, %rax  
je case_5  
cmp $7, %rax  
je case_7
```

These are our
primes

```
jmp default
```

2/27/2017

Sacramento State - Cook - CSc 35 - Spring 2017

79

Assembly Code: The Cases

```
case_2:
```

```
case_3:
```

```
case_7:
```

```
case_9:
```

```
    mov $1, Result
```

```
    jmp End
```

```
default:
```

```
    mov $0, Result
```

All these labels will be
at the same address.
You, of course, would
write prettier code.

2/27/2017

Sacramento State - Cook - CSc 35 - Spring 2017

80
